Where are we

The buildroot project

- Started in 2005
- Focus on simplicity
- Minimalist
- Still very active
- Supported by few companies

Yocto umbrella

- Born in 2010
- Covers different smaller projects:
 - Bitbake (2005)
 - OpenEmbedded
 - Poky

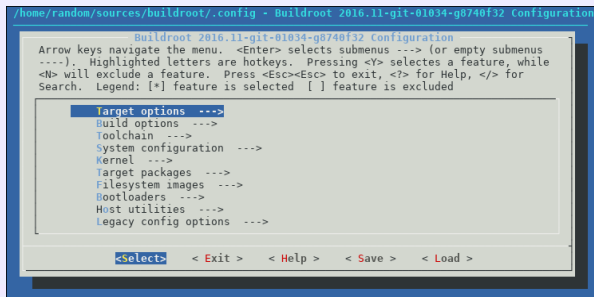

- Supported by many big actors of the market

Core system

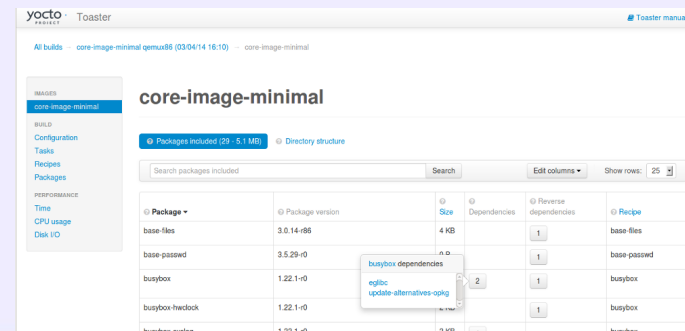

- make
- Makefile
- Kconfig
- menuconfig

yocto
PROJECT

- Bitbake
- Recipes (OE)
- Meta-layers (Poky)
- Files / ENV
- Toaster web UI

Where both are good

- Documentation
- Community
- Amount of available packages
- Support many build and source type
 - http(s) / ftp / git / ~~SVN~~ / ...
 - Makefile / autotools / cmake / qmake / ...
- Output image type
- Toolchain (glibc, musl libc)
- Offline builds

Where yocto is good

- SDK / Canadian cross
- Shared artifacts
- Incremental builds
- Packages repository
- Licensing

- No by design!
- No by design!
- Not smart
- Evil (full update)
- Generates meta info

Some metrics

Version	2016.08.1	2.1 (krogoth)
Available packages	1991	4163
Configuration	raspberrypi2_defconfig	meta-raspberrypi MACHINE="raspberrypi2" core-image-minimal
Build time	2H05	6H12 (image) 3H45 (SDK)
SDK size	-	90Mb
Workspace size	5274Mb	26530Mb (image) 36580Mb (+SDK)
Image size	88Mb	53Mb
Root file system size	45Mb	5.6Mb
Boot time	17 seconds	18 seconds

When should I use buildroot

- Few developers (<5)
 - They can hack at each level of the system
 - Familiar with Makefile/KConfig
- Full system update
- Build time is not important

When should I use yocto

- Many developers
- SDK
- Many platforms
- Fast incremental builds
- Continuous integration infrastructure
- Update package

Why should I NOT use yocto

- Heavy weight
- Learning curve

Other alternatives

- Makefile/Kconfig
 - OpenWRT
 - ~~ptx~~dist
- OE / Bitbake
 - Ångström
- Destkop distributions
 - Linux From Scratch
 - ALFS
 - emerge (Gentoo)
 - pkgbuild (Archlinux)
 - xbps (Void Linux)

Conclusion

? Questions ?
